**Question** What is an example program using the MOV instruction in 8086 microprocessor assembly? A simple example is moving data from one register to another: `MOV AX, 1234h`; this loads the hexadecimal value 1234h into the AX register. How can I write an 8086 assembly program to add two numbers using ADD instruction? You can load the numbers into registers and use the ADD instruction: `MOV AX, 5; MOV BX, 10; ADD AX, BX`; After execution, AX will contain 15. Can you give an example of using the LOOP instruction in an 8086 program? Certainly. For example: `MOV CX, 5; LOOP_START: ; some instructions; LOOP LOOP_START`; This loop executes 5 times,

decrementing CX each time until CX is zero. How do I implement conditional branching with the 8086 JZ and JNZ instructions in a program? You can compare values using CMP; then use JZ (Jump if Zero) or JNZ (Jump if Not Zero) to control flow. For example: CMP AX, 10; JZ label; If AX equals 10, program jumps to label. What is an example program using the INT 21h instruction for DOS services in 8086? To display a string, load the string address into DS:DX and call INT 21h with AH=09h: MOV DX, OFFSET message; MOV AH, 09h; INT 21h; where message is a '\$'-terminated string.
